Name check Edit Mode Version
Updated by Mathias PFAUWADEL 1.0

## **Patch Notes**

• 1.0:1st version working

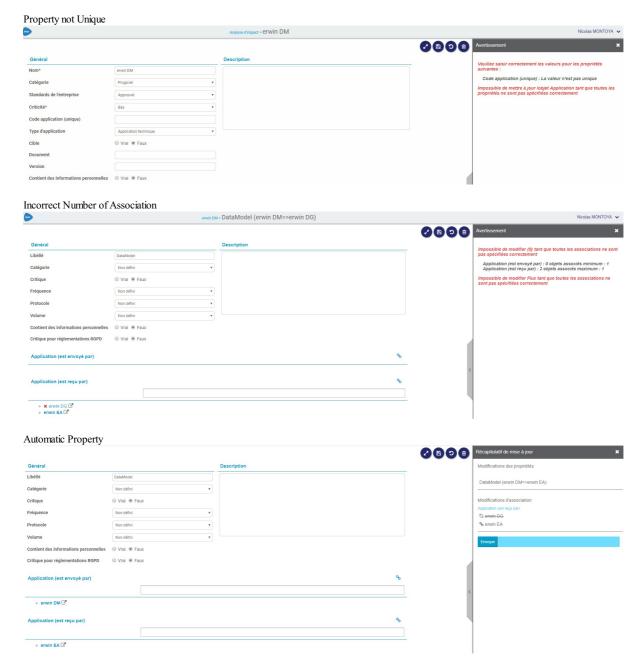

## To be Done

- More Options
- Add Translations for IT...

## **Description**

Check if an object has the right number of associations, some unique property and can fill automatically some property

#### Screen

## Installation

## How to set up

You can find configuration file inside

C:\Casewise\Evolve\Site\bin\webDesigner\custom\Marketplace\libs\checkEditMode\src\checkEditMode.js

```
var globalConfig = {
  viewName: {
    automaticProperty: {
       propertyScriptname: "custom display string"
    },
    uniqueProperty: {
       propertyScriptname: "viewName" // should contain all the object with the property to check
    },
    associations: {
       AssociationNodeID: {
       min: minimum number of association,
       max: maximum number of association
       }
    }
};
```

If you use a tableComplexe to create an object using an objectPage, the association node is the node of the complexe table Example :

```
var globalConfig = {
  flux : {
    automaticProperty: {
      name: "{libéllé} (<$application_20005_994692143$>=><$application_20006_430592262$>)"
    },
    uniqueProperty: {
      code: "check_flux"
    },
    associations: {
      application_20005_994692143: {
      min: 1,
      max: 1
    },
    application_20006_430592262: {
      min: 1,
      max: 1
    }
}
```

# Result

If the flux you want to create has a code which is already taken by another flux which is on the indexpage check\_flux, you will have an error message

If you put inside the node application  $20005_994692143$  or application  $20006_430592262$ , less than 1 or more than 1 application, you will have an error message

The name will be automatically fullfill with the label (associated objet of application\_20005\_994692143 => associated objet of application\_20006\_430592262)

Be carefull to save your configuration before updating to a new version
